# Solving Systems: Elimination

Today, we need to solve a mystery:  
What are Ms. Oldham and  
Ms. Wise's favorite numbers?

- They are not the same number.
- They could be negative (-) or positive (+)
- Their sum is 18.
- They are both prime.

To find them let's consider other fave numbers:

$$\left[ \begin{array}{c} \_ + \_ \\ \_ + \_ \end{array} \right] = \left[ \begin{array}{c} \_ \\ \_ \end{array} \right] \left. \begin{array}{l} \\ \\ \end{array} \right\} \text{answers vary}$$

①                      ②

Add the numbers in box (matrix) 1 →

Add the numbers in box (matrix) 2 →

How do the sums compare? The two sides are equal.

Will these equality hold if we multiply one equation?

$$2 \cdot \left( \begin{array}{c} \_ + \_ \\ \_ + \_ \end{array} \right) = \left( \_ \right) \cdot 2 \rightarrow \left[ \_ \ \_ \right] = \left[ \_ \right]$$

Are the two matrices equal again?

Yes !!

What patterns are you seeing?

Let's use the patterns to solve the mystery!

Let Ms. Oldham's favorite number be  $x$   
and Ms. Wise's favorite number be  $y$ .

We know that the sum of  $x$  and  $y$  is 18.

So we have:

$$x + y = 18$$

Do you know enough to solve for  $x$  and  $y$ ?

Here is one more hint:  $x + 3y = 32$

$$x + y = 18$$

$-1(x + 3y = 32)$  • multiply equation #2 by  $-1$

$$x + y = 18$$

• add the 2 equations together

$$+ \quad -x - 3y = -32$$

$$0 - 2y = -14$$

$$y = 7$$

• Now, we know  $x$  or  $y$ !

We can solve for the other.

$$x + y = 18$$

• Choose an equation and solve

$$x + 7 = 18$$

for the remaining variable.

$$x = 11$$

Ms. Oldham's favorite number is 11.

Ms. Wise's favorite number is 7.

Congratulations! You just used **ELIMINATION!**

NOTES

# Solving Systems by Elimination

1. Arrange the equations with like terms in columns.
2. Multiply, if necessary, to create opposite coefficients for one variable.
3. Add/Subtract the equations.
4. Substitute the value to solve for the other variable.
5. Write your answer as an ordered pair.
6. Check your answer.

$$\begin{array}{r} 1. \quad 2x - 2y = -8 \\ + \quad 2x + 2y = 4 \\ \hline 4x + 0 = -4 \\ 4x = -4 \\ x = -1 \end{array}$$

$(-1, 3)$

check:

$$2(-1) - 2(3) = -8$$

$$-2 - 6 = -8 \checkmark$$

$$\begin{array}{r} 2. \quad 4x + 3y = 16 \\ + \quad 2x - 3y = 8 \\ \hline 6x + 0 = 24 \\ 6x = 24 \\ x = 4 \end{array}$$

whiteboard

$(4, 0) \checkmark$

$$\begin{array}{r} 2(-1) - 2y = -8 \\ -2 - 2y = -8 \\ -2y = -6 \\ y = 3 \end{array}$$

$$\begin{array}{r} 4(4) + 3y = 16 \\ 16 + 3y = 16 \\ 3y = 0 \\ y = 0 \end{array}$$

$$\begin{array}{r} 3. \quad 3x + 2y = 7 \\ + \quad -3x + 4y = 5 \\ \hline 0 + 6y = 12 \\ 6y = 12 \\ y = 2 \end{array}$$

$(1, 2)$

$$3(1) + 2(2) = 7 \checkmark$$

$$-3(1) + 4(2) = 5 \checkmark$$

$$\begin{array}{r} 3x + 2(2) = 7 \\ 3x + 4 = 7 \\ 3x = 3 \\ x = 1 \end{array}$$

$$\begin{array}{r} 4. \quad 2x - 3y = -2 \quad 8x - 12y = -8 \\ 2. \quad -4x + 5y = 2 \quad -8x + 10y = 4 \\ \hline 0 - 2y = -4 \\ y = 2 \end{array}$$

\* ask for alternate numbers

$$\begin{array}{r} 2x - 3(2) = -2 \\ 2x - 6 = -2 \\ 2x = 4 \\ x = 2 \end{array}$$

$$2(-2) - 3(2) = -2 \checkmark \quad (2, 2)$$

$$-4 - 6 = -10 \checkmark$$

$$\begin{array}{r} 4. \quad 5x + 2y = 7 \quad 20x + 8y = 28 \\ 5. \quad -4x + y = -16 \quad -20x + 5y = 80 \\ \hline 0 + 13y = 52 \\ y = 4 \end{array}$$

$$\begin{array}{r} -4. \quad 2x + 3y = 1 \quad -8x - 12y = -4 \\ 2. \quad 4x - 2y = 10 \quad + \quad 8x - 4y = 20 \\ \hline 0 - 16y = 16 \\ y = -1 \end{array}$$

$$\begin{array}{r} 5x + 2(4) = 7 \\ 5x - 8 = 7 \\ 5x = 15 \\ x = 3 \end{array}$$

$$\begin{array}{r} 2x + 3(-1) = 1 \\ 2x - 3 = 1 \\ 2x = 4 \\ x = 2 \end{array}$$
